TechVolt - Electronic Components E-Commerce Website

Tools Used in Project *

HTML5, CSS3, JavaScript, PHP, MySQL

Abstract (About 300 words) *

TechVolt – Electronic Components E-Commerce Website is a web-based application designed to provide a convenient platform for purchasing electronic components online. The system is developed for students, hobbyists, engineers, and electronics enthusiasts who need easy access to quality electronic products. The website offers a wide range of components, including Arduino Uno, Arduino Nano, ESP32, NodeMCU, Raspberry Pi, sensors, resistors, capacitors, ICs, motors, displays, power modules, and other electronic accessories. The application provides a simple and user-friendly interface where customers can register, log in, browse products by category, search for specific items, view product details, add products to the shopping cart, and place orders. Customers can also manage their profiles and view their order history.

The website includes a secure admin panel that enables administrators to manage products, categories, inventory, customer information, and orders efficiently. The admin can add, edit, or remove products, update stock quantities, and monitor sales through the system.

The project is developed using HTML, CSS, JavaScript, PHP, and MySQL, with Wampp used as the local server environment. The database stores all information related to users, products, categories, orders, and inventory.

The primary objective of TechVolt is to simplify the buying and selling of electronic components through an online platform while improving inventory management and customer experience. This project demonstrates web development, database management, user authentication, CRUD operations, and e-commerce functionality. Future enhancements may include online payment integration, order tracking, product reviews, and AI-based product recommendations.
